Platysma

Platysma

Platysma[6]	Subcutaneous tissue of infraclavicular and supraclavicular regions	Base of mandible; skin of cheek and lower lip; angle of mouth (modiolus); orbicularis oris	Depresses mandible (against resistance); tenses skin of inferior face and neck (conveying tension and stress)

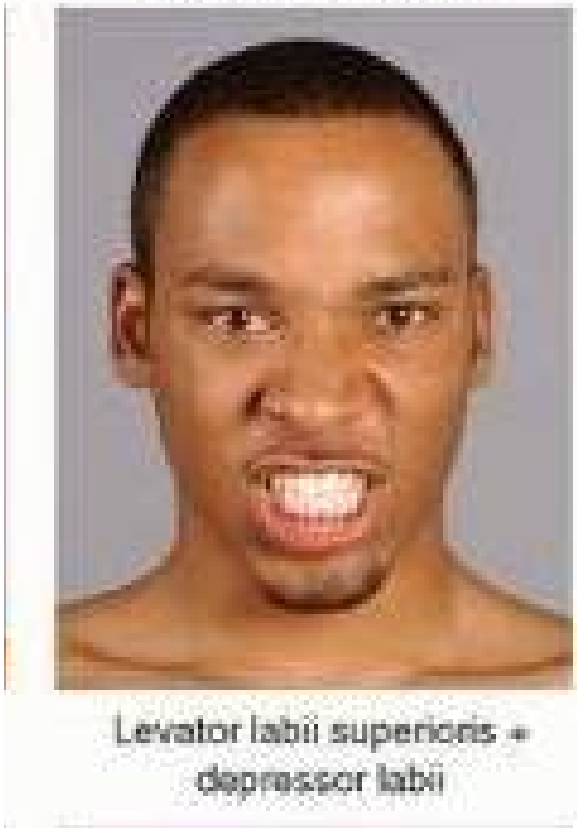

Mentalis

Mentalis[5]	Body of mandible (anterior to roots of inferior incisors)	Skin of chin (mentolabial sulcus)	Elevates and protrudes lower lip; elevates skin of chin (showing doubt)

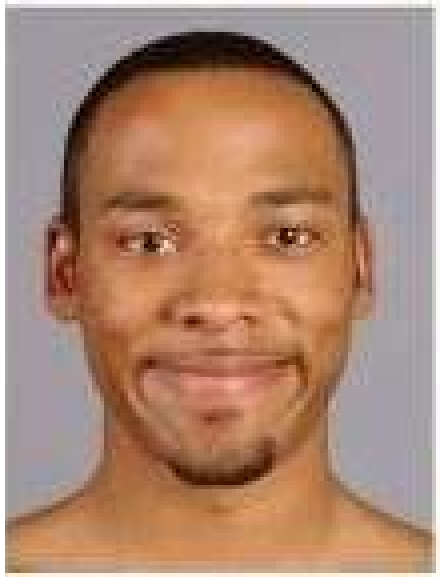

Dilators of mouth:
Risorius plus levator labii superioris + depressor labii inferioris

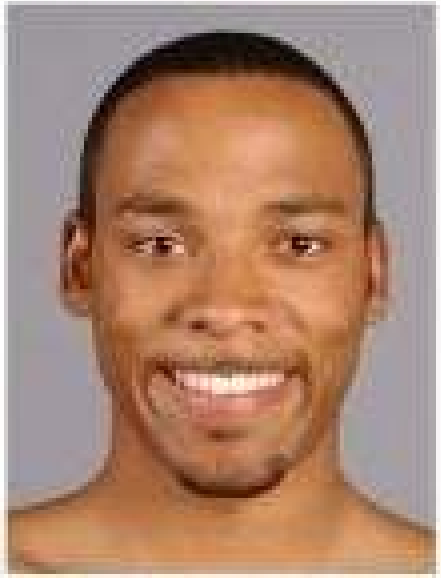

Levator labii superioris + depressor labii

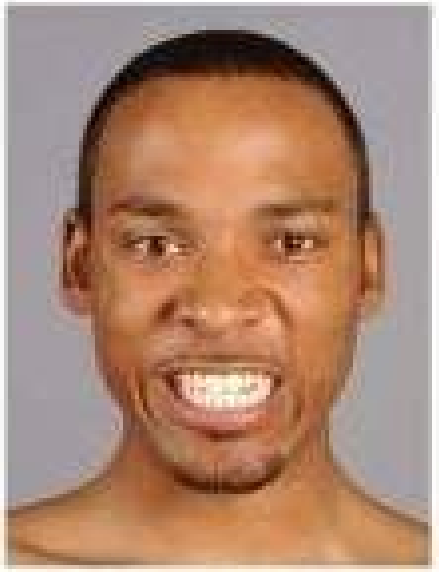

Depressor labii inferioris[5]	Platysma and anterolateral body of mandible	Skin of lower lip	Part of dilators of mouth; retracts (depresses) and/or everts lower lip (pouting, sadness)

Risorius

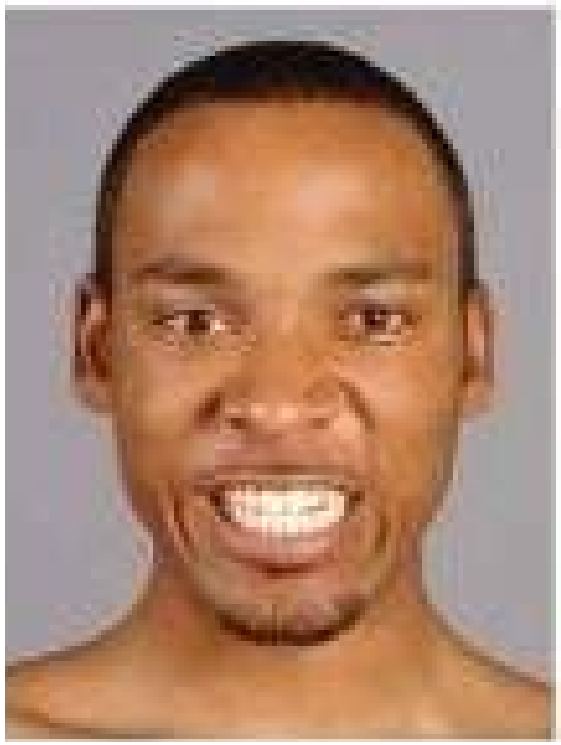

Risorius + depressor labii inferioris

Dilators of mouth: Risorius plus levator labii superioris + depressor labii inferioris

Risorius[4]	Parotid fascia and buccal skin (highly variable)	Angle of mouth (modiolus)	Part of dilators of mouth; depresses labial commissure bilaterally to frown (sadness)
Depressor anguli oris[5]	Anterolateral base of mandible		

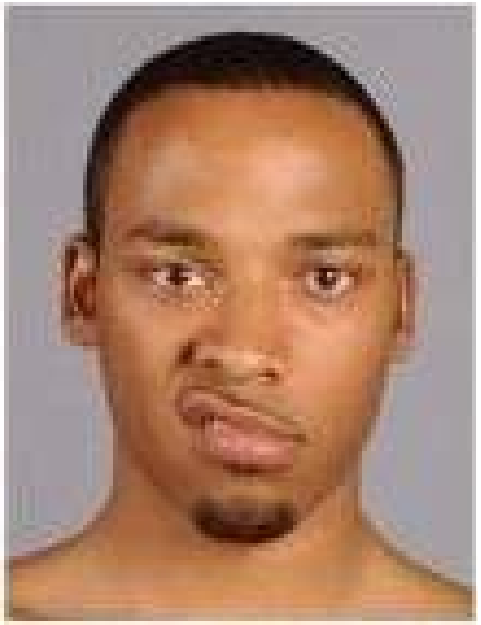

Levator anguli oris[4]

Infra-orbital maxilla (canine fossa)

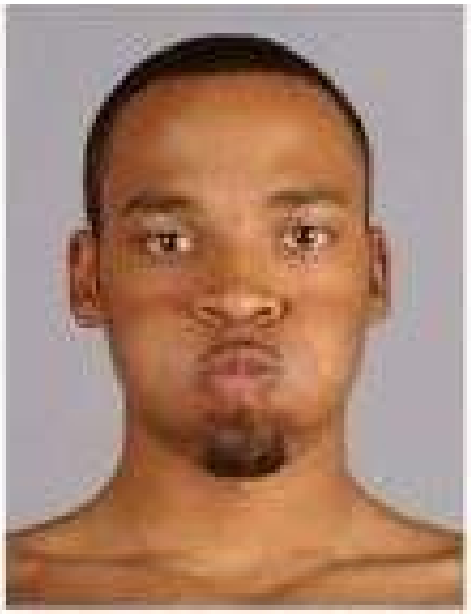

Angle of mouth (modiolus)

Part of dilators of mouth; widens oral fissure, as when grinning or grimacing

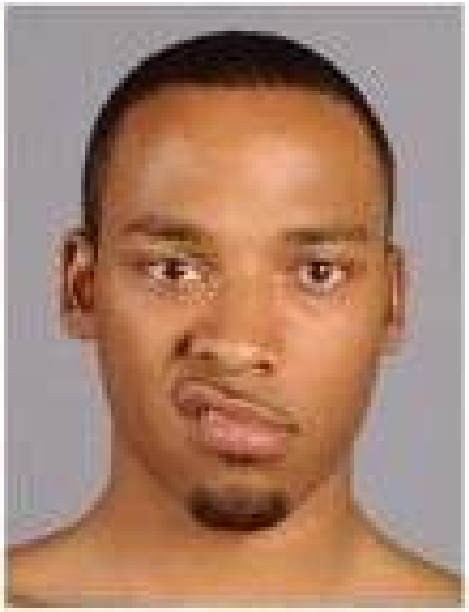

Zygomaticus major + minor

Zygomaticus major[4]	Lateral aspect of zygomatic bone	Angle of mouth (modiolus)	Part of dilators of mouth; elevate labial commissure—bilaterally to smile (happiness); unilaterally to sneer (disdain)

Buccinator + orbicularis oris

Buccinator (cheek muscle)[4]	Mandible, alveolar processes of maxilla and mandible, pterygomandibular raphe	Angle of mouth (modiolus); orbicularis oris	Presses cheek against molar teeth; works with tongue to keep food between occlusal surfaces and out of oral vestibule; resists distension (when blowing)

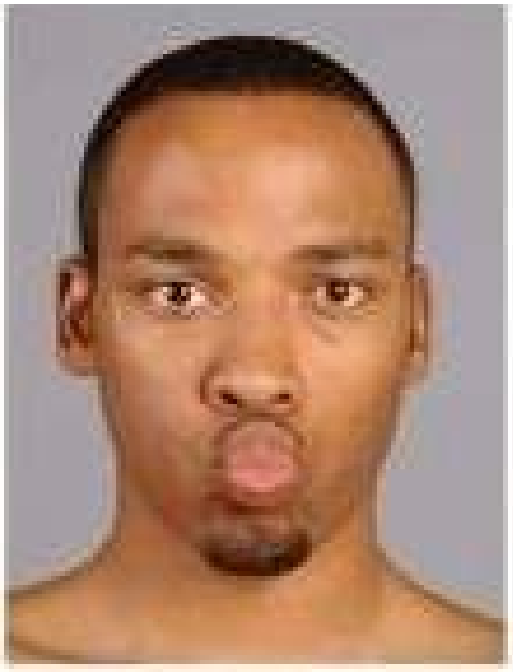

Zygomaticus major + minor

Levator labii superioris + depressor labii

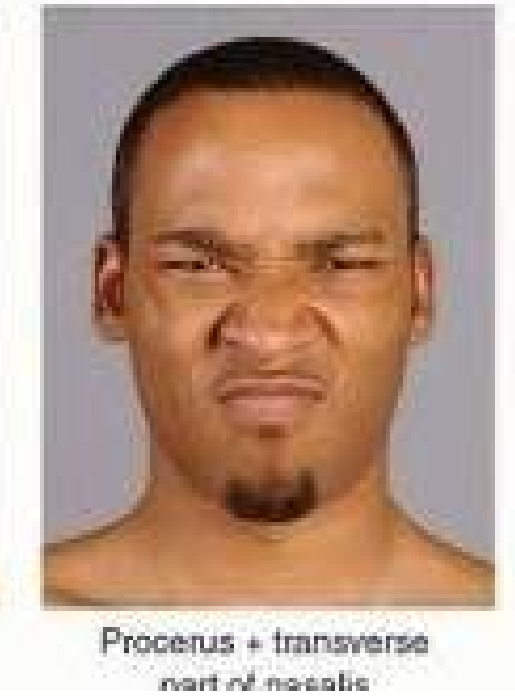

Levator labii superioris[4]	Infra-orbital margin (maxilla)	Skin of upper lip	Part of dilators of mouth; retract (elevate) and/or evert upper lip; deepen nasolabial sulcus (showing sadness)
Zygomaticus minor[4]	Anterior aspect, zygomatic bone		

Orbicularis oris (oral sphincter)[4]	Medial maxilla and mandible; deep surface of perioral skin; angle of mouth (modiolus)	Mucous membrane of lips	Tonus closes oral fissure; phasic contraction compresses and protrudes lips (kissing) or resists distension (when blowing)

Alar part of nasalis plus levator labii superioris alaeque nasii[4]	Frontal process of maxilla (inferomedial margin of orbit)	Major alar cartilage	Depresses ala laterally, dilating anterior nasal aperture (i.e., "flaring nostrils," as during anger or exertion)

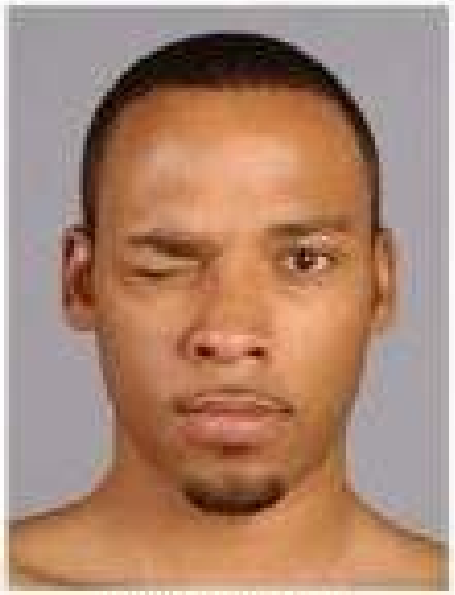

Procerus plus transverse part of nasalis[4]	Fascia aponeurosis covering nasal bone and lateral nasal cartilage	Skin of inferior forehead, between eyebrows	Depresses medial end of eyebrow; wrinkles skin over dorsum of nose (conveying disdain or dislike)

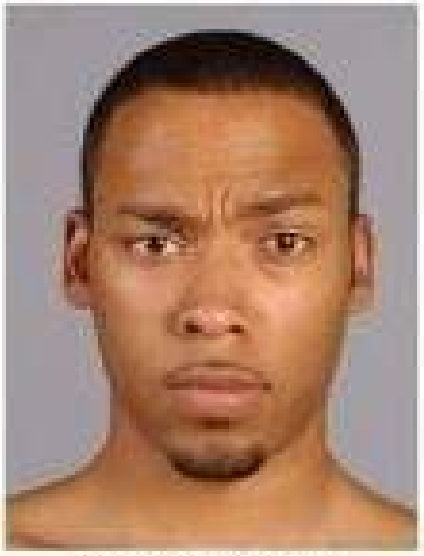

Occipitofrontalis

Front belly[2]	Epicranial aponeurosis	Skin and subcutaneous tissue of eyebrows and forehead	Elevates eyebrows and wrinkles skin of forehead; protracts scalp (indicating surprise or curiosity)

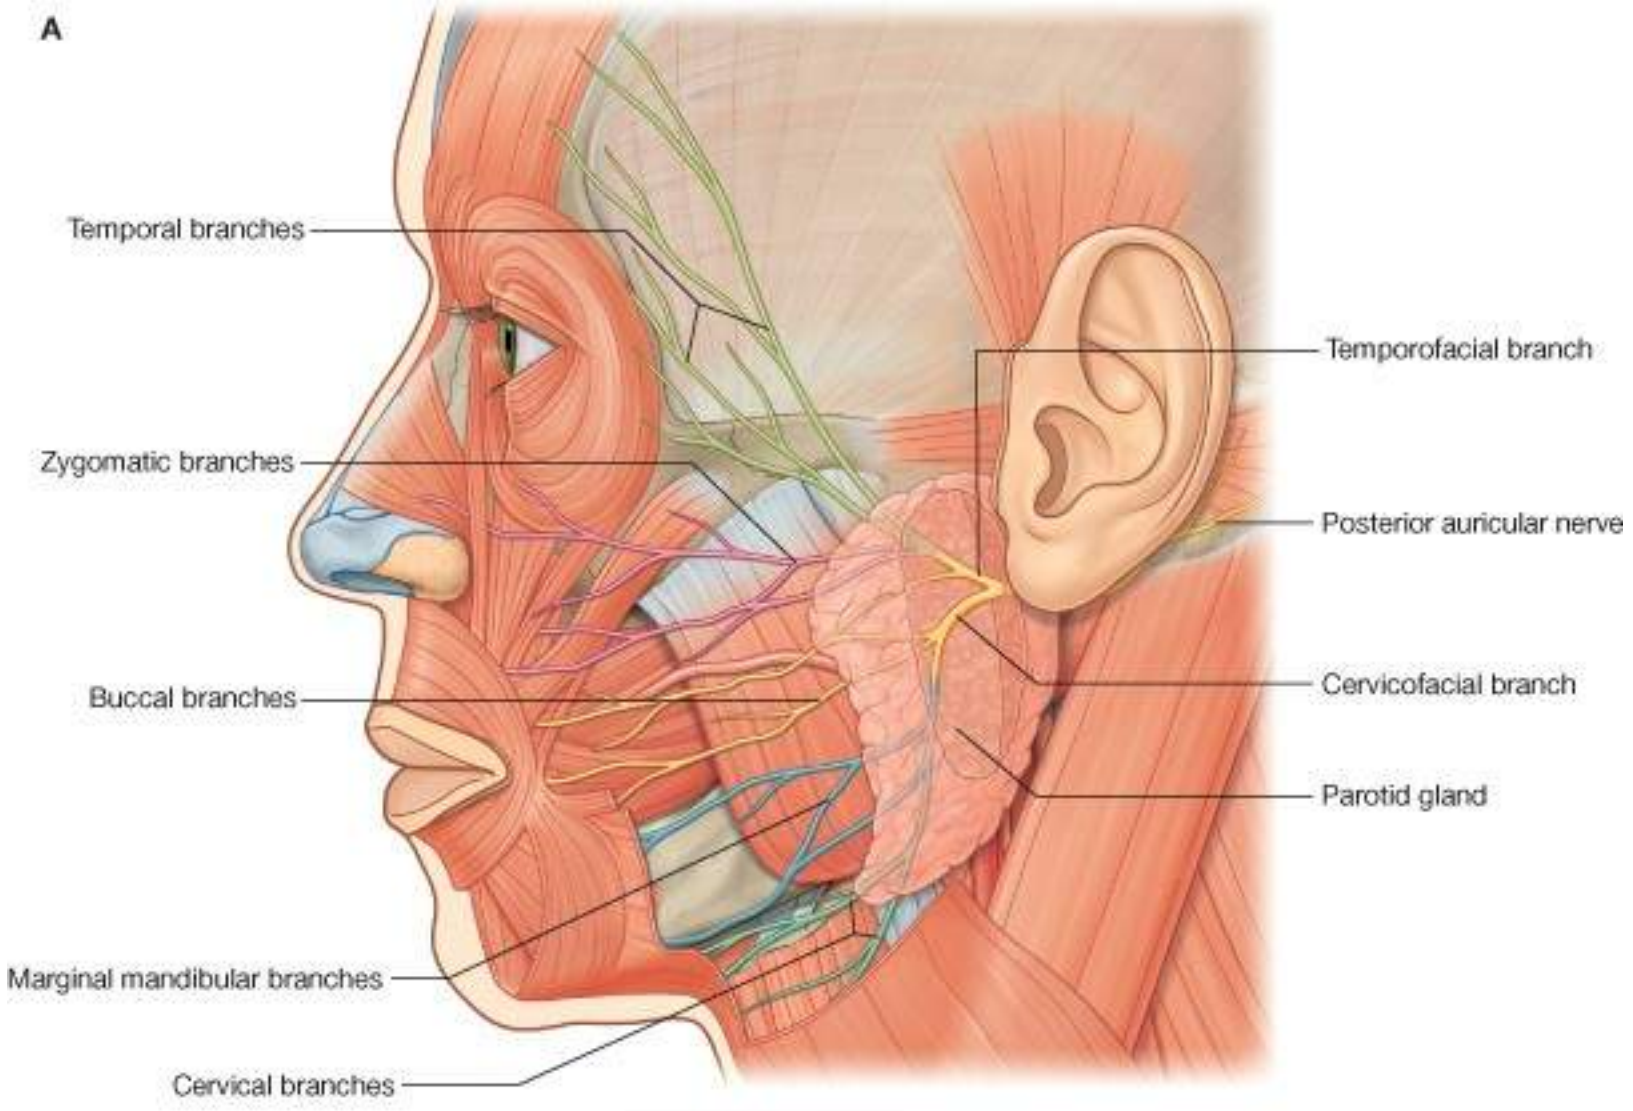

Orbicularis oculi

Orbicularis oculi (orbital sphincter)[2,3]	Medial orbital margin; medial palpebral ligament; lacrimal bone	Skin around margin of orbit; superior and inferior tarsal plates	Closes eyelids: palpebral part does so gently; orbital part tightly (winking)

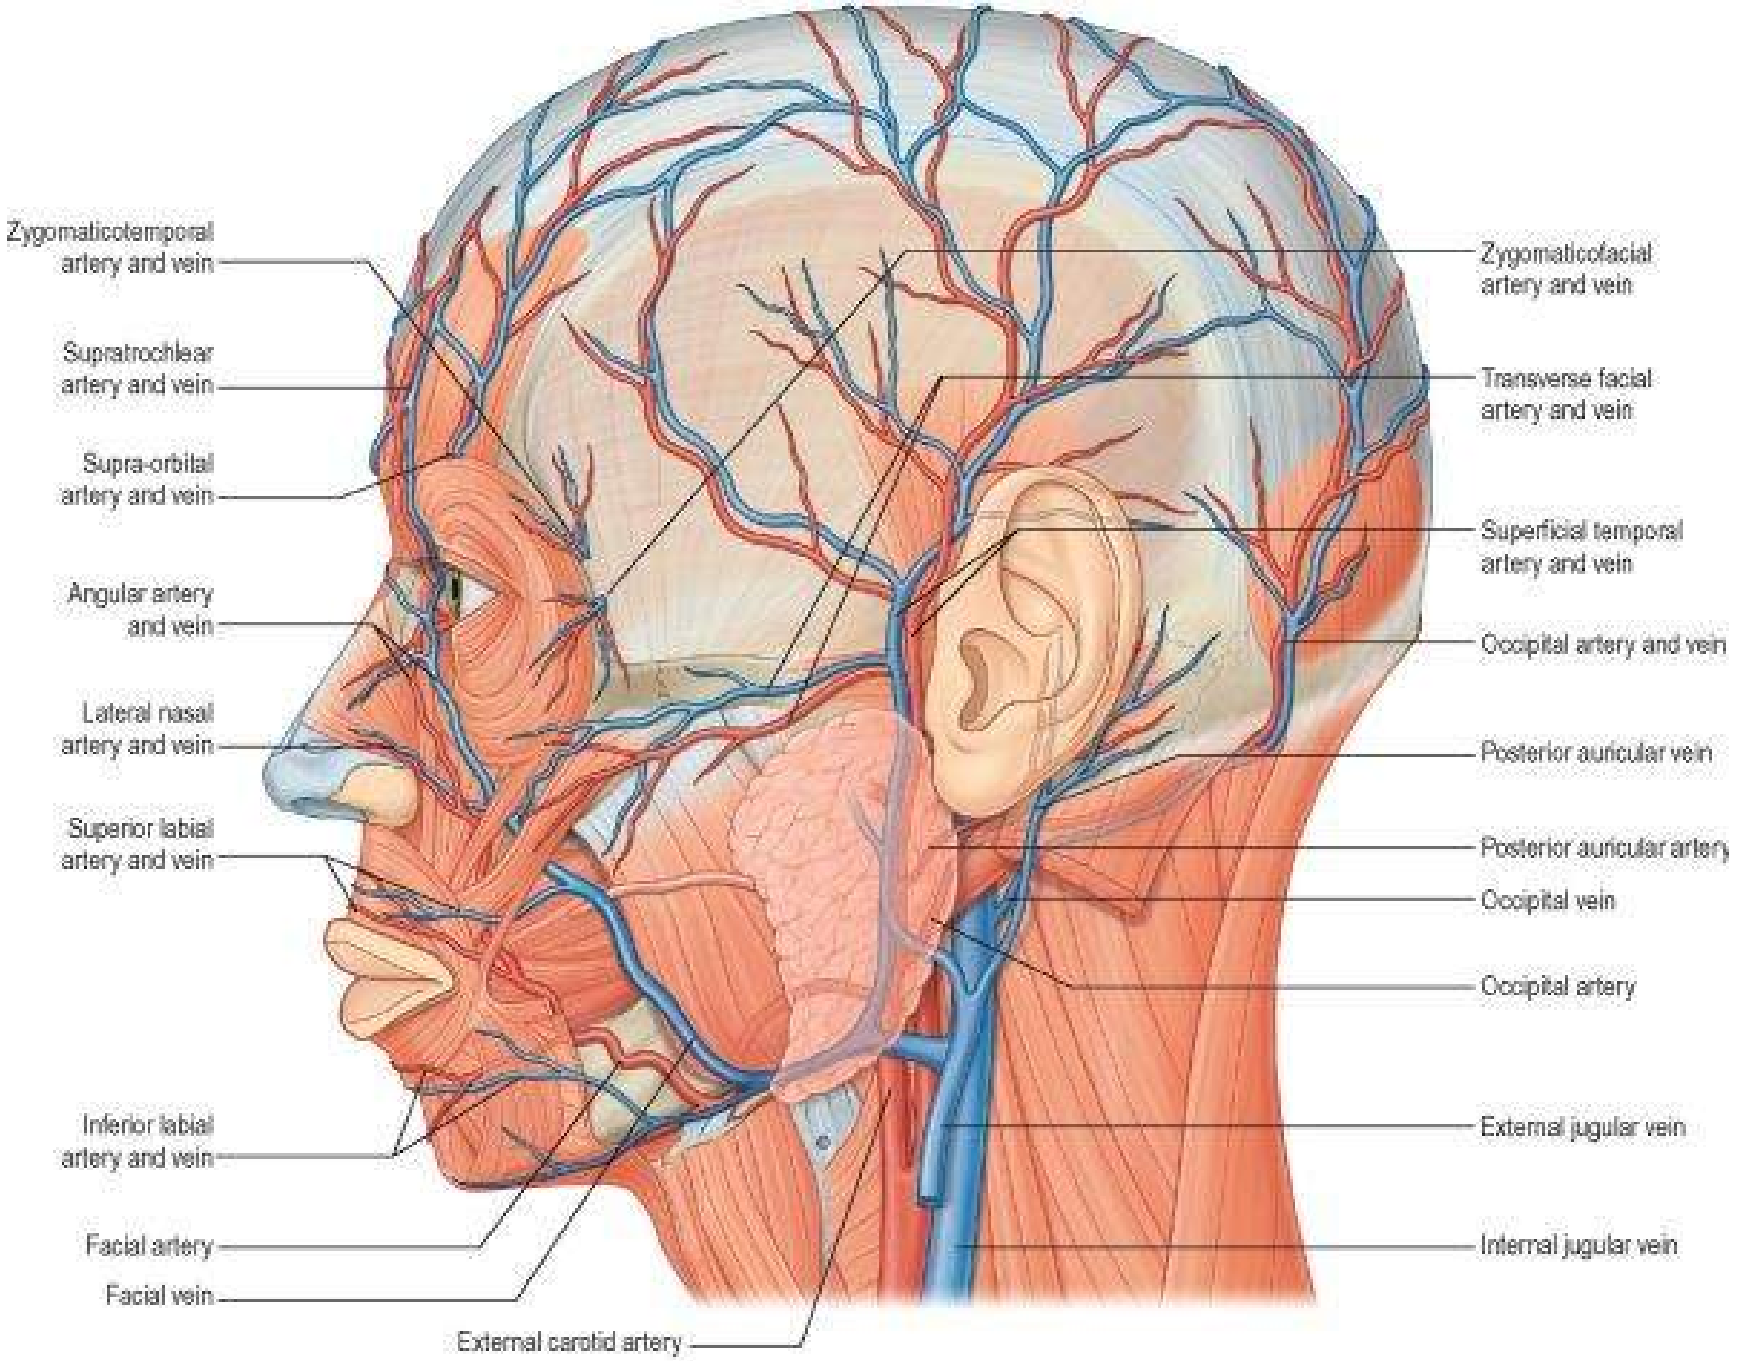

Corrugator supercilii[2]	Medial end of superciliary arch	Skin superior to middle of supraorbital margin and superciliary arch	Draws eyebrow medially and inferiorly, creating vertical wrinkles above nose (demonstrating concern or worry)
