RESPIRATORY SYSTEM OSPE

DAY 2

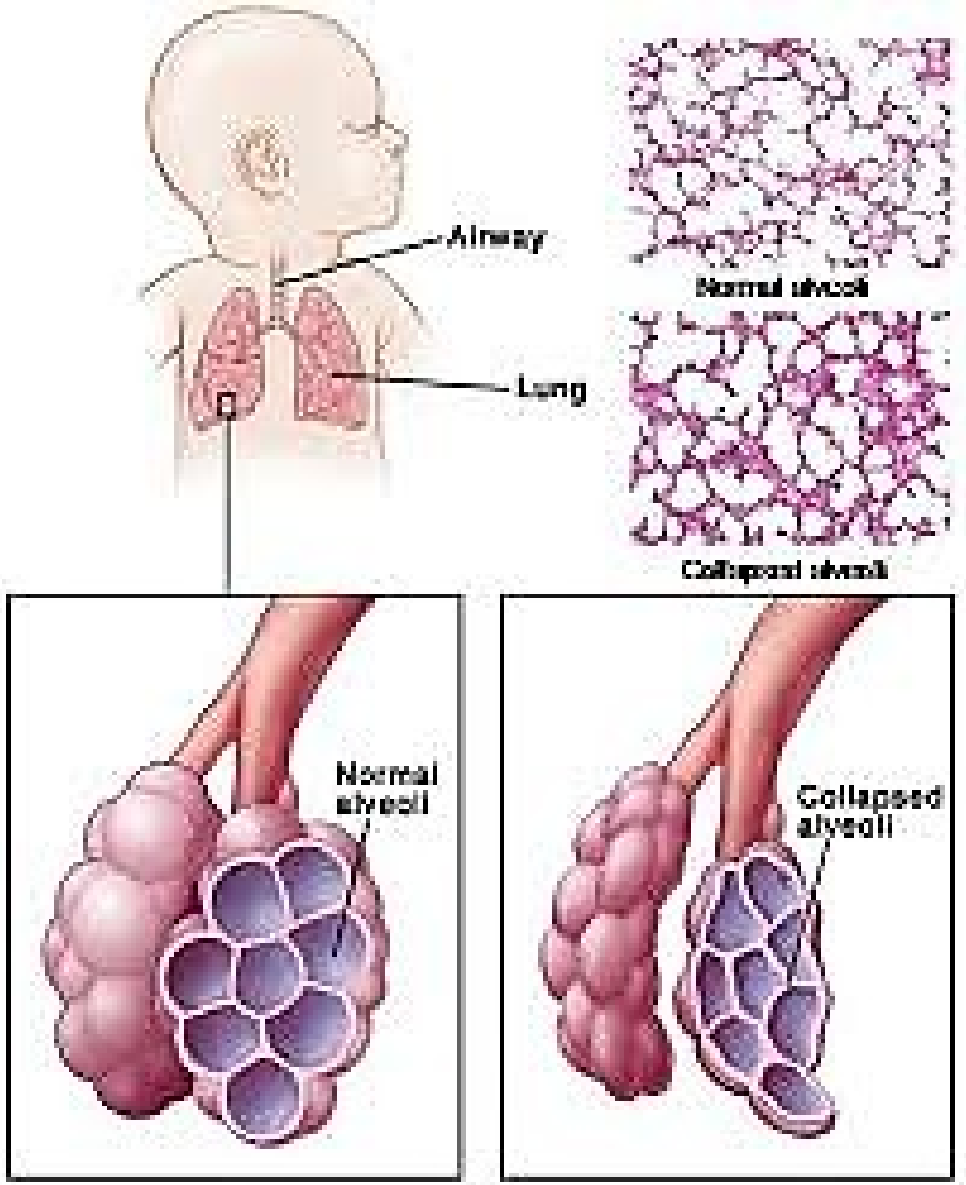

SPOT NO.1

1. Identify the physiological event shown in the graph.
2. State what happens to alveolar pressure during inspiration.
3. Name the principal muscle responsible for this change.
4. Explain why intrapleural pressure remains negative throughout the cycle.

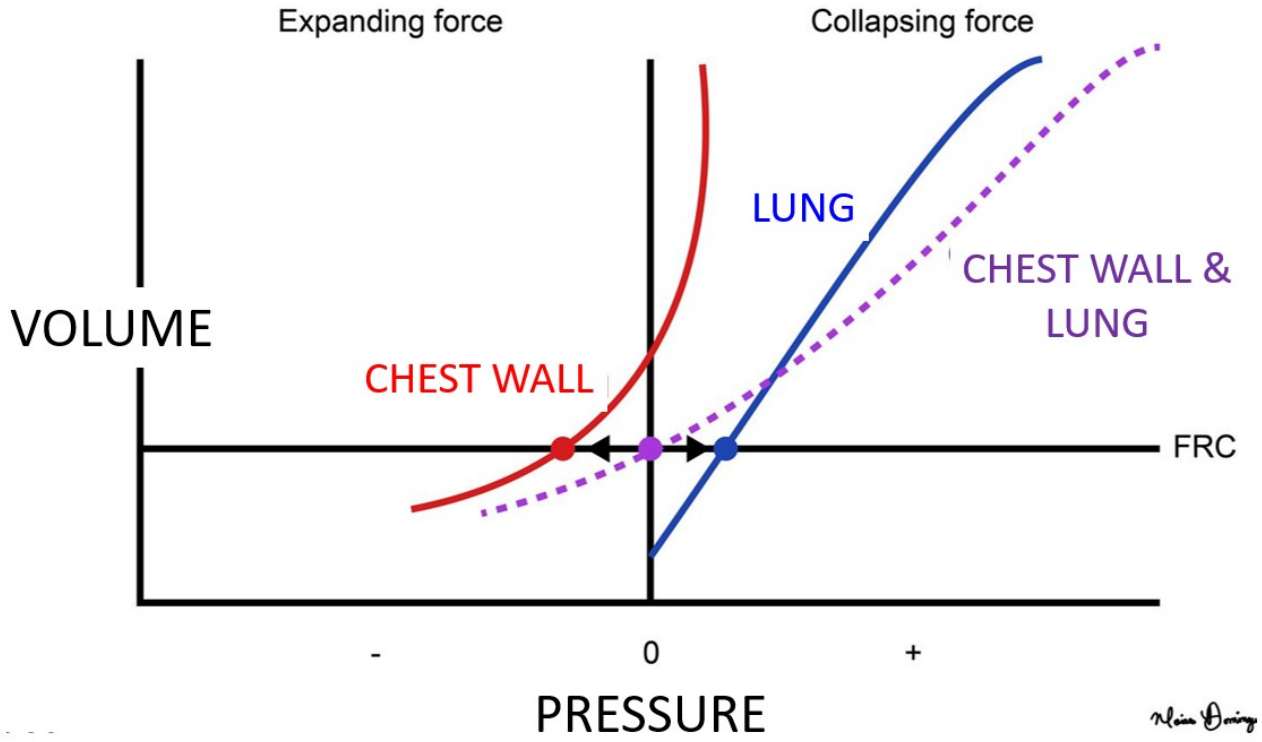

SPOT NO.2

1. Identify the structure shown in the diagram.
2. State the major chemical component of pulmonary surfactant.
3. Mention one physiological function of surfactant.
4. Explain the consequence of surfactant deficiency in premature infants.

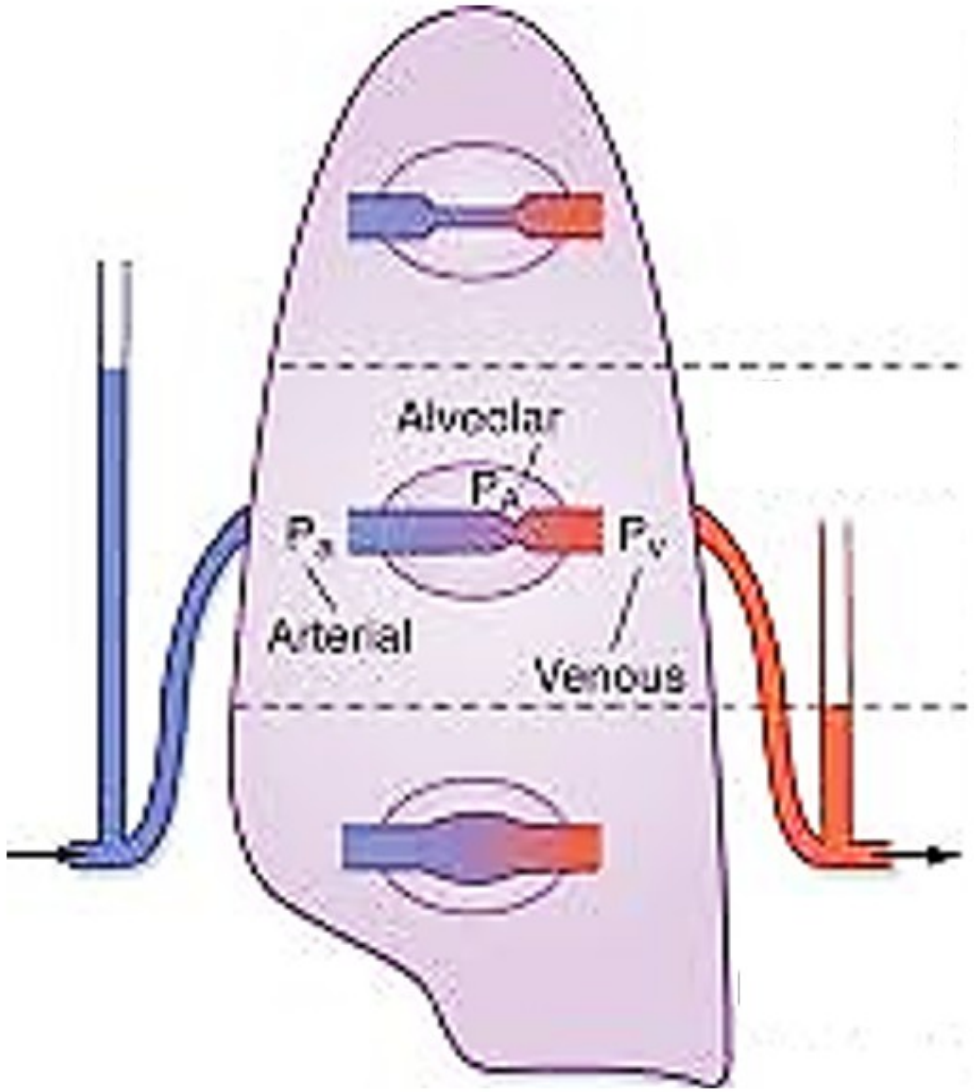

SPOT NO.3

1. Identify the type of graph shown.
2. Define lung compliance.
3. Name one condition that decreases lung compliance.
4. Name one factor that increases lung compliance.

SPOT NO.4

1. Identify the diagram shown.
2. Name the physiological factor that causes different zones of pulmonary blood flow.
3. Which zone has the highest blood flow?
4. Which pressure is highest in Zone 1?

SPOT NO.5

1. Identify the graph shown.
2. What does plateau phase of the curve represent?
3. Name two factors that shift the curve to the right.
4. What is the physiological significance of the steep portion of the curve?
